Claim Objections

1. Claim 14 is objected to because of the following informalities:

The meaning of the term “fro” in line 4 is unclear.

Appropriate correction is required.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3. Claims 1-18 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. The term “microknife” has been used in conjunction with different medical fields. Ashraf (US 6,197,039 b1) describes the use of a microknife for hair transplant. Michelson (US 5,423,842) discloses the use of a microknife in spinal surgery. It is not clear as to the functionality and structure of the microknife recited in the instant specification. Applicant discloses that the microknife is used to harvest the fat cell beneath a person’s skin before the cells can be converted to fatty acid and glycerol. It is therefore of imperative significance to

understand how the microknife is operated and functioned. It is the position of the examiner that the disclosure fails to teach people of ordinary skill in the art as how the body fat is harvested and collected from the human body before it is converted to reactant gas for the fuel cell.

Conclusion

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Yao et al. (US 4,294,891) teach an implantable miniature fuel cell that is intermittently refuelable through refueling ports. Keller (US 6,294,281) teaches a biological fuel cell comprising an anode enzyme and a cathode enzyme.
